  2.7.1 C++ Programming 114
2.8 Master's Thesis 117
1 Preambles and Indications

For technical reasons the preamble of the module catalogue was relocated. It can be found at Regulations and Module Handbook in the category “Module Catalogues” on the pages of the Department EIM-E. Please take account of this preamble. In case of questions relating to this preamble, please contact

- the Student Advisory Service of Electrical Systems Engineering or
- the Course Management of Electrical Engineering.

Please also note that

1. all modules are listed in this module catalogue as determined by the respective examination regulation even if they are not offered in the current semester.
2. this module catalogue contains the content of the database on the creation date. All information supplied is subject to correction.
2 Module Descriptions

2.1 Module Group: Introduction to Electrical Systems Engineering

The modules of this group are compulsory to all MS-ESE students.

<table>
<thead>
<tr>
<th>Module Group Introduction to Electrical Systems Engineering</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modules</td>
</tr>
<tr>
<td>Teaching objectives</td>
</tr>
</tbody>
</table>

The first module will provide a theoretical and methodological understanding of electrical systems. Nowadays, the process of developing electrical systems is assisted by various modeling and simulation tools. Therefore, the second module will give an overview of the underlying principles of modeling and simulation techniques and discuss their advantages as well as their limits.

2.1.1 Advanced System Theory

<table>
<thead>
<tr>
<th>Advanced System Theory</th>
</tr>
</thead>
<tbody>
<tr>
<td>Module number: M.048.92001</td>
</tr>
<tr>
<td>Semester number: 1.-3. Semester</td>

#### 4 Contents:

**Short Description**
Building on an undergraduate system theory course, this course studies the dynamical behavior of linear systems with greater mathematical rigor. The course is primarily intended to serve students in engineering, but it can also be useful to students in physics and other natural sciences.

**Contents**
System models and differential equations, state-space and I/O descriptions, relations between internal and external descriptions, response of continuous- and discrete-time systems, stability, controllability, observability, state-space realizations of external descriptions, feedback systems.

#### 5 Learning outcomes and competences:

After attending this course, students will be familiar with the most important concepts and results in linear system theory. Students will develop confidence in their ability to solve mathematical problems of analysis and design. Many of their timeless insights and intuitions about the dynamical behavior of systems will be drawn from this course. This course presents material broad enough so that students will have a clear understanding of the dynamical behavior of linear systems, including their power and limitations. This will allow students to apply the theory to other fields.

#### 6 Assessments:

- Modulabschlussprüfung (MAP)
- Modulprüfung (MP)
- Modulteilprüfungen (MTP)

keine

4 Contents: 

Short Description 
In this lecture, techniques of constructing models and simulations of technical systems are introduced and implemented 

Contents 
- Introduction to the modeling process 
- Number representation in digital computers 
- Numerical schemes for ordinary and partial differential equations 
- Discrete simulations

5 Learning outcomes and competences: 

Domain competence 
After attending the course, the students will be able to 
- categorize and analyze modelling schemes and numerical methods 
- identify and apply numerical methods for technical-physical systems 
- illustrate and physically evaluate the obtained results 
- extend, develop and validate numerical algorithms

6 Assessments:

3 Admission requirements:
Keine

4 Contents:

Short Description
In this course students will acquire soft skills how to manage technical projects (e.g., requirements analysis, specification, scheduling, planning and designing, monitoring & controlling, communication in teams, communication with customers).

Contents
Foundations - The Project and its Environment:
- Types of Projects
- Stakeholder Analysis
- Project Organization and Structure
- Project Success Factors

Operative Project Management (Hard Factors):
- Project Phases and Objectives
- Project Structure
- Scheduling
- Cost and Resource Planning
- Change Management
- Quality Management
- Controlling
- Project Completion and Lessons Learned

Humans in Projects (Soft Factors):
- Team Building and Leadership
- Communication in Teams
- Problem and Conflict Resolution
Module Descriptions

5 Learning outcomes and competences:

Domain competence
The participants are able to describe and use the fundamentals of technical project management.

Key qualifications
The participants are able to describe the aspects of communication in teams and make use of techniques to solve problems and conflicts.

6 Assessments:

8 Prerequisites for participation in examinations:

None

9 Prerequisites for assigning credits:

None

10 Weighing for overall grade:

The credit points are awarded after the module examination (MAP) was passed.

11 Reuse in degree courses:

keine

12 Module coordinator:

Dr. Stephan Flake

13 Other Notes:

Implementation
The participants will use the theoretical and methodic fundamentals from the lecture notes for a project work about a selected topic. In some of the later lectures, the participants will present the results of their project work in a short presentation, followed by a discussion with the other participants and feedback.

Teaching Material, Literature
Lecture notes will be provided for each individual lecture. There are various good reference lists available in the Internet, e.g., http://ipma.ch/education/recommended-literature/. Further hints will be given during the course.
### 2.2.2 Topics in System Engineering

<tr>
<td>Varying</td>
</tr>
</tbody>
</table>
5 Learning outcomes and competences:

Domain competence:
The students are

• able to do scientific research and to present scientific findings,
• to accumulate findings and knowledge autonomously and to reflect them in a critical manner.

By intensifying the course contents of the master's program the students are confronted with research questions and methodology as well as project management of Electrical System Engineering.

Key qualifications:
The students

• are able to design technical presentation and
• are familiar with basic presentation techniques.

6 Assessments:

☐ Modulabschlussprüfung (MAP) ☐ Modulprüfung (MP) ☐ Modulteilprüfungen (MTP)

<table>
<thead>
<tr>
<th>zu</th>
<th>Type of examination</th>
<th>Duration or scope</th>

8 Prerequisites for participation in examinations:
None

9 Prerequisites for assigning credits:
Die Vergabe der Leistungspunkte erfolgt, wenn die Modulabschlussprüfung (MAP) bestanden ist. The credit points are awarded after the module examination (MAP) was passed.

10 Weighing for overall grade:
The module is weighted according to the number of credits (factor 1).

11 Reuse in degree courses:
keine

12 Module coordinator:
Dr.-Ing. Carsten Balewski
2 Module Descriptions

2.3 Module Group: Fundamentals of Electrical Systems Engineering

These compulsory elective modules are meant to close gaps in the knowledge of students. They choose two from a list of six modules.

<table>
<thead>
<tr>
<th>Module Group</th>
<th>Fundamentals of Electrical Systems Engineering</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modules</td>
<td>* Circuit and Systems Design</td>
</tr>
<tr>
<td></td>
<td>* Fields &amp; Waves</td>
</tr>
<tr>
<td></td>
<td>* Digital Speech Signal Processing</td>
</tr>
<tr>
<td></td>
<td>* High Frequency Engineering</td>
</tr>
<tr>
<td></td>
<td>* Introduction to Algorithms</td>
</tr>
<tr>
<td></td>
<td>* Mechatronics and Electrical Drives</td>
</tr>
<tr>
<td></td>
<td>* Software Engineering</td>
</tr>
</tbody>
</table>

Teaching objectives As students with quite different backgrounds may enter this Master's program it is necessary to harmonize their knowledge background.

For a student with a Bachelor degree in Electrical Engineering it may be e.g. necessary to fill up knowledge gaps in the field of Software Engineering, while students with a Computer Engineering degree should perhaps attend a module in Mechatronics & Electrical Drives. Students will be advised on which two modules out of the following list to choose from.

<table>
<thead>
<tr>
<th>Advanced Control</th>
</tr>
</thead>
<tbody>
<tr>
<td>Module number:</td>

</tbody>
</table>

### 2 Options within the module:
None

### 3 Admission requirements:
keine

### 4 Contents:

**Short Description**
This course builds on undergraduate-level systems theory and automatic control courses and focuses on the design of discrete-time control systems, using transfer function and state space methods. The course is primarily intended to serve engineering students, but can also be useful to students in physics and other natural sciences.

**Contents**
- Discretisation of dynamical systems
- Analysis of linear time-invariant single input single output control loops using transfer function methods: Sensitivity functions, stability analysis, modelling errors and robustness,
- controller design via pole placement and Youla parameterisation
- Actuator constraints and anti-windup mechanism
- dynamic programming
- linear quadratic regulator
- Kalman filter
- model predictive control

### 5 Learning outcomes and competences:

**Domain competence:**
After attending this course, students will be able to
- study the dynamics of discrete-time feedback systems
- design appropriate control systems

**Key qualifications:**
Students learn
- to use systematic analysis and synthesis methods that can be used in a variety of disciplines, both in engineering and natural sciences
- precise methods based on abstractions that can be used to further independent learning
### 2 Module Descriptions

### Module Descriptions

#### Short Description

The course introduces the basic techniques and theories of digital speech signal processing. A focal point of the first part of the lecture is the topic “Listening and Speaking”, which is concerned with psychological effects of human sound perception and speech production. Subsequently, time discrete signals and systems, as well as computer based data processing are discussed. Further topics are non-parametric short-time analysis of speech signals, speech coding and IP-phones.

#### Contents

- **Listen and talk**
  - Generating voice: human vocal tract, source filter model, vocoder
  - Acoustic waves
  - Listen: human ear, psycho acoustics and physiology of listening, loudness, acoustic occlusion, frequency groups
- **Time-discrete signals and systems**
  - Basics: Elementary signals, LTI systems
  - Transforms: Fourier transformation of time-discrete signals, DFT, FFT
  - Time-discrete filtering in frequency domain: Overlap-Add, overlap-Save
- **Statistical speech signal analysis**
  - Basics in theory of probabilities
  - Short-run analysis of speech signals: Spectrogram, cepstrum
- **Estimation of speech signals**
  - Optimal filters
  - LPC analysis
  - Spectral filtering for noise suppression: spectral subtraction, Wiener filter
  - Adaptive Filters: LMS adaptation algorithm, echo compensation
- **Speech coding**
  - Time domain coding: signal shape coding, parametric coding, hybride coding techniques
  - Frequency domain coding
  - Amplitude quantization: uniform quantization, quantization with companders (ulaw, alaw)

### Learning outcomes and competences:

#### Domain competence:

After attending the course, the students will be able to

- analyze digital signals, e.g., audio signals, in the time or frequency domain,
- represent audio signals efficiently and
- implement widely-used algorithms for speech analysis and speech processing in the frequency or time domain.

#### Key qualifications:

The students

- are able to explain effects in real signals based on the theoretical knowledge,
- are able to investigate theoretical approaches by a systematic analysis and
- are, due to the precise treatment of the contents, in a position to continue their learning themselves
### Assessment:
- **Modulabschlussprüfung (MAP)**
- **Modulprüfung (MP)**
- **Modulteilprüfungen (MTP)**

<table>
<thead>

### Weighing for overall grade:
The module is weighted according to the number of credits (factor 1).

### Reuse in degree courses:
keine

### Module coordinator:
Dr.-Ing. Jörg Schmalenströer

### Other Notes:
**Module Homepage**

**Implementation**
- Lectures using the blackboard and presentations,
- Alternating theoretical and practical exercise classes with exercise sheets and computer and
- Demonstration of real technical systems in the lecture hall.

**Teaching Material, Literature**
Allocation of a script; information on textbooks; matlab scripts

### High Frequency Engineering

2. **Options within the module:**
None

3. **Admission requirements:**
Keine

4. **Contents:**

**Short Description**
This lecture gives application-oriented knowledge in high frequency engineering. Furthermore, it gives knowledge in active and passive high-frequency circuits.

**Contents**
The lecture High-Frequency Engineering (4 SWS, 6 ECTS credit points) extends the content of the lecture Theoretische Elektrotechnik by further application-relevant knowledge. The aim is to qualify the students for development tasks for example in the radio frequency part of a mobile telephone. But considerations of high-frequency engineering are also needed in prevalent digital circuits. The emphases of the lecture are passive devices, high-frequency properties of fundamental transistor circuits, linear and nonlinear amplifiers, noisy multiports, mixers, oscillators, injection-locking and phase-locked loop.

5. **Learning outcomes and competences:**

**Professional Competence**
After attending the course, the students will be able, in the taught extent, to understand the function of components, circuits and systems of high-frequency engineering, to model and to apply them.

**(Soft) Skills**
The students

- are able to apply the knowledge and skills to a wide range of disciplines,
- are able to make use of a methodical procedure when undertaking systematic analysis and
- are, due to the abstract and precise treatment of the contents, in a position to continue and develop their learning themselves

### 2 Options within the module:

None

### 3 Admission requirements:

keine

### 4 Contents:

**Short Description**
The course gives an introduction into the design and analysis of algorithms.

**Contents**
Sorting algorithms, basic data structures, graphs and graph algorithms, design and analysis of algorithms (problem complexity, run time and storage complexity of algorithms, exact vs. heuristic solutions, probabilistic approaches)

### 5 Learning outcomes and competences:

**Domain competence:**
After attending the course, the students will be able

- to describe and explain basic algorithms and data structures,
- to apply them to new problems,
- to analyze and evaluate the developed solutions with respect to run time,
- to implement the developed algorithms in a modern object oriented programming language.

**Key qualifications:**
The students

- are able to apply the practiced strategies for problem solving across varying disciplines,
- have experience in developing solutions and implementing them together in cooperation with their fellow students,
- know how to improve their competences by private study.

### Contents:

#### Short Description

The course first explains and defines the term mechatronics as interdisciplinary area between electrical and mechanical engineering and information technology. Various application examples are shown. As a typical example, the magnetic bearing is comprehensively discussed. As a method, energy principles are applied. Further mechatronic examples address the switched reluctance motor and the electronically commutated DC motor.

#### Contents

- Introduction and definition of mechatronic systems
- Basic structure of mechatronic systems (flow of energy, material and information, control loop)
- Modeling based on energy principles (internal energy, co-energy)
- Modeling and computation of magnetic circuits (field, reluctance, inductance, flux, MMF)
- Ferromagnetic and permanent magnet materials
- Modeling and control of a mechatronic system taking a magnetic bearing as an example
- Switched reluctance motor
- DC motor
- Brushless DC motor (characteristics, structure, modeling, power electronics, control)
2 Module Descriptions

5 Learning outcomes and competences:

Domain competence:
- Understanding of mechatronic systems as interacting electromagnetic, mechanic and information processing components
- System modeling based on energy principles

Key qualifications:
- Application of known principles in different disciplines
- Extension of the ability to abstract
- Functional reflection

4 Contents:

Short Description
The course on Statistical and Machine Learning presents an introduction into the components and algorithms prevalent in statistical and machine learning. Modern techniques will be presented for gleaning information from data. Both supervised and unsupervised learning algorithms will be discussed. The presented techniques can be applied to a variety of classification and regression problems, both for one-dimensional input data (e.g., speech), two-dimensional (e.g., image) or symbolic input data (e.g., documents).

Contents
- Introduction to classification problems, Bayesian and other decision rules
- Optimization: gradient descent, algorithmic differentiation, optimization with constraints
- Linear classifiers, Support Vector Machines
- Deep neural networks (deep learning)
- Dimensionality reduction (PCA, LDA)
- Unsupervised learning (mixture densities, clustering techniques)
2 Module Descriptions

5 Learning outcomes and competences:

Domain competence:
After completion of the course students will be able to

- Find an appropriate approach to solving a given classification or regression problem
- Apply supervised or unsupervised learning techniques to data of various kinds and critically assess the outcome of the learning algorithms
- Can appreciate the power and limitations of machine learning algorithms
- Work with software for solving machine learning problems and write own software components, apply them to given data sets and optimize parameter settings
- Find, for a given training set size, an appropriate choice of classifier complexity und feature vector dimensionality

Key qualifications:
The students

- Have gathered sufficient proficiency in Python, which is valuable well beyond this course
- Can assess the importance of the principle of parsimony and are able to transfer it to other
- Are able to analyse a given classification or regression problem, synthesize a solution, and evaluate the performance on test data
- Are able to apply the knowledge and skills learnt in this course to a wide range of disciplines
- Can work cooperatively in a team and subdivide an overall task into manageable subtasks and work packages
- Acquired a general understanding of the power and limitations of machine learning algorithms

6 Assessments:

☐ Modulabschlussprüfung (MAP) ☐ Modulprüfung (MP) ☐ Modulteilprüfungen (MTP)

### 2 Module Descriptions

| 11 | Reuse in degree courses: | keine |
| 12 | Module coordinator: | Prof. Dr. Reinhold Häb-Umbach |

**Implementation**
- Lectures predominantly using the blackboard or overhead projector, occasional presentations of (powerpoint) slides,
- Exercise classes with exercise sheets and demonstrations on computer
- Implementation of learning and classification algorithms on a computer by the students themselves; use of algorithms on real-world data or data generated on the computer, evaluation of the simulation results

**Teaching Material, Literature**
Course script and summary slides are provided to the students. Exercises and solutions to exercises, as well as sample implementations of algorithms are provided to the students.

Contents:

Short Description
Statistical signal processing comprises the techniques that engineers and statisticians use to draw inference from imperfect and incomplete measurements. This course covers a selection of topics from the major domains of detection, estimation, and time series analysis.

Contents
Topics that may be covered in this course include correlation analysis, linear minimum mean-squared error estimation, performance bounds for parameter estimation, Neyman-Pearson detectors, wide-sense stationary, nonstationary and cyclostationary time series, and complex-valued random signals.

Learning outcomes and competences:
After attending this course, students will be familiar with the basic principles of statistical signal processing. They will understand how to apply statistical signal processing techniques to relevant fields in electrical engineering (such as communications). Students will develop confidence in their ability to solve mathematical problems of analysis and design. They will be able to apply the principles they have learnt in this course to other areas.

#### Short Description

This course builds on undergraduate-level systems theory and automatic control courses and focuses on the design of discrete-time control systems, using transfer function and state space methods. The course is primarily intended to serve engineering students, but can also be useful to students in physics and other natural sciences.

#### Contents

- Discretisation of dynamical systems
- Analysis of linear time-invariant single input single output control loops using transfer function methods: Sensitivity functions, stability analysis, modelling errors and robustness,
- controller design via pole placement and Youla parameterisation
- Actuator constraints and anti-windup mechanism
- dynamic programming
- linear quadratic regulator
- Kalman filter
- model predictive control
5 **Learning outcomes and competences:**

**Domain competence:**
After attending this course, students will be able to

- study the dynamics of discrete-time feedback systems
- design appropriate control systems

**Key qualifications:**
Students learn

- to use systematic analysis and synthesis methods that can be used in a variety of disciplines, both in engineering and natural sciences
- precise methods based on abstractions that can be used to further independent learning

6 **Assessments:**

<table>
<thead>
<tr>
<th>Modulabschlussprüfung (MAP)</th>
<th>Modulprüfung (MP)</th>
<th>Modulteilprüfungen (MTP)</th>

4 Contents:

Short Description
The course Advanced Topics in Robotics is based on the course Robotics. The students are introduced to current research topics in the field of autonomous and teleoperated mobile robots to solve interdisciplinary issues. The challenges encountered in developing intelligent mobile systems are analyzed and current solutions presented.

Contents
- Architectures of robot systems
- Middleware for hardware abstraction
- Device drivers and libraries
- Visualization
- Local navigation processes (collision avoidance)
- Global navigation processes (pathfinding)
- Navigation and self-localization methods (SLAM)
- Fundamentals of task planning

5 Learning outcomes and competences:

Domain competence:
The students
- are able to name and analyze the basic robot architectures for mobile robots,
- have a good command of the methods for the navigation and control of mobile robots and
- are able to implement, test and apply them.

Key qualifications:
The students have a good command of programming in the C language

Implementation
- The theoretical and methodical fundamentals will be introduced during the lecture.
- The methods presented will be practiced during the subsequent exercise / lab part.
- Finally, the participants will implement, test, and apply simple algorithms.
- The necessary programming skills will be taught during the practical, this is explicitly not considered a programming course.

Teaching Material, Literature
Allocation of lecture notes; information on textbooks stocked in the textbook collection will be announced later.
- Mertsching, Bärbel: Robotics (lecture notes)

### 4 Contents:

**Short Description**
The course “Algorithms and Tools for Test and Diagnosis of Systems on Chip” deals with advanced topics in test and diagnosis of integrated systems. The focus is on algorithms and tools for computer-aided preparation and application of test and diagnosis procedures.

**Contents**
Topics include but are not restricted to:
- Advanced techniques for built-in self-test and embedded test
- Built-in diagnosis
- Test of robust and self-adaptive systems
- Adaptive Testing

### 5 Learning outcomes and competences:

**Domain competence:**
After attending the course, the students will be able
- to describe recent approaches in test and diagnosis,
- to explain and apply the underlying models and algorithms,
- to explain the specific challenges of nanoscale integration and evaluate test strategies accordingly.

**Key qualifications:**
The students are able
- to apply their basic knowledge for studying and understanding new approaches from the state of the art literature,
- to present the new contents in a conference style presentation, and
- to describe the new contents in a scientific manuscript.

<tbody>
<tr>
<td>This module is offered in two parts. Students have to choose two out of three. Each part lasts two hours per week and yields three credits.</td>
</tr>
</tbody>
</table>

- **Cognitive Systems Engineering A - Visual Attention**

In the winter semester a project seminar takes place which introduces students to the modeling and experimental research of visual attention, and thus to current research at the chairs of GET Lab and Cognitive Psychology. It is also intended to demonstrate the possibility of joint research across boundaries of different disciplines. The current focus lies on salience.

- **Cognitive Systems Engineering B - Sensation and Perception in Biological Systems**

Part B (summer semester) offers a broad overview of the fundamentals of sensation and perception in biological systems and the associated intriguing phenomena. The treatment of these topics is interwoven with a critical discussion concerning the implementation of bio-inspired mechanisms in technical systems.

- **Cognitive Systems Engineering C - GET Research Seminar**

In summer semester and winter semester various presentations take place: current interim reports and results of seminar papers and diploma theses in progress, research projects and third-party funded projects focusing on research in the field of technical cognitive systems; lectures by guests of the GET Lab.

*Contents of the course Cognitive Systems Engineering A - Visual Attention:*

Keine

4 Contents:
Short Description
The course "Digital Image Processing I" is a fundamental module in the catalog "Cognitive Systems" of the Electrical Engineering Master's program and related courses of studies. The course provides a fundamental introduction to digital image processing.

Contents
- Basic principles (coordinates, types of image data, human perception, light and electromagnetic spectrum)
- Image acquisition (sampling, quantization, aliasing, neighborhoods)
- Image enhancement in the spatial domain (transformations, histograms, arithmetic and logarithmic operations, spatial filters in general, smoothing filters, edge filters)
- Image enhancement in the frequency domain (Fourier Transform, smoothing filters, edge filters)
- Compression and reduction of image data (basic principles, compression models, information theory, compression standards)

5 Learning outcomes and competences:
Domain competence:
The students
- are able to describe the basics of image generation and image digitization and
- are able to select, implement, test and apply methods for the enhancement of images in the spatial and frequency domain, image segmentation and data reduction independently for complex image processing tasks.

Key qualifications:
The students have a good command of programming in the C language and C++.

6 Assessments:

**Short Description**

The course “Digital Image Processing II” is a module in the catalog “Cognitive Systems” for advanced students of the Electrical Engineering Master's program and related courses of studies. It follows the fundamental course “Digital Image Processing I” and describes methods for feature extraction and object recognition.

**Contents**

- Wavelets and multiresolution processing (Image pyramids, Wavelet transforms)
- Image segmentation (Line- and edge detection, thresholding, region-based segmentation, watershed algorithm, motion)
- Representation and description (chain codes, signatures, contour descriptors, regional descriptors)
- Stereo Image Analysis (depth perception, stereo geometry, correspondence problem)
- Motion estimation (optical flow, motion models, motion segmentation)
- Object recognition (object descriptions, classifiers, probabilistic approaches)

## 5 Learning outcomes and competences:

**Domain competence:**

The students

- are able use the basic methods for image segmentation,
- have a good command of the probabilistic methods for the description of image features and object recognition,
- are able to transfer the acquired knowledge of image processing to the processing of other multi-dimensional signals and
- are able to describe the state-of-the-art of the presented topics.

**Key qualifications:**

The students are able to identify and evaluate the function and the behavior of complex technical processes and their integration into the social environment while also considering ethical aspects.

**Short Description**

Dynamic programming is a method for solving decision making problems consisting of a number of stages, by breaking down the problem into simpler sub-problems. These methods have wide applicability in areas such as optimization, control, communications, and machine learning. This course will cover the modelling and solution of problems of sequential decision making under uncertainty. We will consider problems with both a finite and an infinite number of stages, as well as cases with perfect and imperfect observations of the system. Numerical techniques for solving these problems will be described, including suboptimal methods for when the state and/or action spaces are large.

**Contents**

Topics to be covered in this course will include:

- The dynamic programming principle and dynamic programming algorithm
- Problems with perfect state information
- Problems with imperfect state information
- Infinite horizon problems
- Suboptimal methods and approximate dynamic programming

Applications to problems in control, communications, signal processing and machine learning, including current research, will be given throughout the course.
2 Module Descriptions

5 Learning outcomes and competences:
After attending this course, students will have understood the basics of dynamic programming and stochastic control. Students will learn the dynamic programming optimality principle and how it can be used to solve multi-stage decision making problems. They will learn how to formulate and solve, using dynamic programming, problems in different areas such as control, communications, signal processing, and machine learning.

6 Assessments:

4 Contents:

Short Description
This course provides an introduction to the sophisticated and powerful Discontinuous Galerkin method in time domain. With this numerical technique it is possible to describe spatiotemporal effects like electromagnetic field propagation and other physical models which can be described by partial differential equations.

Contents
Contents

- Introduction, Motivation, History
- Basic elements of the Discontinuous Galerkin Method
- Linear systems * Theory foundation and discrete stability
- Nonlinear problems and properties
- Higher order, global problems
- Application to electromagnetic field simulation

5 Learning outcomes and competences:

Domain competence:
After attending the course, the student will be able to

- mathematically model complex electromagnetic field problems
- transfer, apply, validate the Discontinuous Galerkin method on physical problems
- to physically interpret and visualise the obtained results

Key qualifications:
The students

- learn to transfer the acquired skills also to other disciplines
- extend their cooperation and team capabilities as well as the presentation skills in the context of solving the exercises
- learn strategies to acquire knowledge from literature and internet
- acquire a specialised foreign language competence

4 Contents:

Short Description
Dielectric optical waveguides constitute key-elements of present-day integrated optical / photonic circuits. This course provides an introduction to their theoretical background, and, as such, a sound basis for further, more specific, modelling, simulation, and design work, as well as for experimental activities in the field.

5 Learning outcomes and competences:

Domain competence:
After attending the course, the student will be able to

- to mathematically model electromagnetic field problems of systems in integrated optics and photonics
- to identify, apply and verify appropriate analytical methods and approximation techniques
- to physically interpret and visualise the obtained results
- to extend, develop and validate theoretical models for integrated optics and photonics

Key qualifications:
The students

- learn to transfer the acquired skills also to other disciplines
- extend their cooperation and team capabilities as well as the presentation skills in the context of solving the exercises
- learn strategies to acquire knowledge from literature and internet
- acquire a specialised foreign language competence

2 Module Descriptions

4 Contents:

Short Description
The course “Optimal and adaptive filters” gives an introduction to the basic techniques and theo-
ries of adaptive filters. Based upon the basics of estimation theory optimal filters are discussed.
Subsequently the topics Wiener filter theory, deterministic optimization under constraints and sto-
chastic gradient methods are regarded. Concluding the Least Squares approach for solving filter
tasks and the Kalman filter are introduced. The latter is regarded as a brief introduction to state
based filters.

Contents

• Classic parameter estimation o Estimators o MMSE-Estimation o Linear estimators o Or-
thogonality principle o Evaluation of estimators
• Wiener filter o Wiener-Hopf equation o AR- and MA processes o Linear prediction
• Iterative optimization methods o Gradient ascent/descent o Newton method
• Linear adaptive filters o LMS algorithm o Least-Squares method o Blockwise and recursive
  adaptiv filters o Realization aspects
• Statemodel based filters o Kalman filter
• Applications o System identification o Channel estimation and equalization o Multi-channel
  speech signal processing o Noise and interference suppression

5 Learning outcomes and competences:

Domain competence:
After attending the course, the students will be able to

• analyze task on the field of adaptive filters and to formulate requirements mathematically,
• develop filter using cost functions and
• implement selected adaptive filters in the frequency or time domain.

Key qualifications:
The students

• are able to check theoretical results using practical realizations,
• are able to undertake theoretical approaches a systematic analysis using methodical pro-
  cedures and
• are, due to the precise treatment of the contents, in a position to continue their learning
  themselves

**Short Description**

The course „Topics in Audio, Speech, and Language Processing” highlights current research topics in audio, speech, and language processing. From the methodological side we will discuss signal processing and machine learning aspects, and in particular their interaction, which is typical for many real-world applications. The selection of topics may change from year to year.

**Contents**

Example topics are:

- Multi-channel signal processing for microphone arrays
- Sampling rate synchronisation
- Machine learning for speech enhancement
- Blind source separation for speech and audio
- „Deep learning“ for acoustic and language modeling in automatic speech recognition
- Neural architectures for speech recognition, speech synthesis, machine translation, etc.
- Natural language processing
5 Learning outcomes and competences:
After completion of the course the students
- Can assess the challenges and realized solutions of modern speech and audio processing systems
- Know the specific properties of speech, audio and language and know how those are exploited in specific signal processing and machine learning algorithms
- Understand the interplay of algorithmic performance, complexity and latency and identify appropriate operating points
- Apply the learnt signal processing and machine learning algorithms to other tasks in speech and audio processing, and beyond
- Understand current scientific literature in the field of audio, speech, and language processing and assess their importance for the field

## Contents:

**Short Description**

The course on Topics in Pattern Recognition and Machine Learning first briefly summarizes the main concepts of statistical pattern recognition and machine learning. Next selected topics will be presented in detail. The choice of topics depends on current research activities and thus may change over time. Examples of such topics to be studied in detail include:

- Deep Learning
- Model estimation in the presence of hidden variables, in order to reveal suspected latent structure buried in the data
- Bias-Variance dilemma and the tradeoff between degree of detail and generalizability of models
- Graphical models
- Sequential data and hidden Markov models
- Specific classification tasks, such as automatic speech recognition

While the first part of the course will follow a regular lecture format, the second part will include active student participation. Students will be asked to read, analyze and present recently published papers from the pattern recognition and machine learning literature. This will often also include the implementation of proposed algorithms in Matlab.

**Contents**

- Fundamentals of statistical pattern recognition: Bayes rule, learning of class-conditional densities, linear models for classification and regression
- Deep neural networks
- EM Algorithm and extensions thereof
- Models with discrete or continuous latent variables; GMM, NMF
- Bias-Variance dilemma and model selection
- Graphical models
- Hidden Markov models and their application in speech recognition
- Recent publications in pattern recognition and machine learning
5 Learning outcomes and competences:

Domain competence:
After completion of the course students will be able to
• Choose an appropriate classifier for a given classification problem and be able to learn the parameters of the classifier from training data
• Choose an appropriate regression method for function approximation and learn its parameters from training data
• Search for latent variables and structure in given data
• Make an informative choice for the model order to find a good compromise between degree of detail and generalizability
• Comprehend and analyze recent publications from the field of pattern recognition and machine learning

Key qualifications:
The students
• Have gathered an understanding of the importance of the chosen model order on the outcome of classification and regression tasks
• Are aware of the impact of a priori assumptions on the result of latent variable and structure discovery in data
• Are able to autonomously gain expertise in a certain field of pattern recognition by conducting a literature survey
• Can gauge the importance of a given publication for the state of the art in a field
• Are able to apply the knowledge and skills learnt in this course to a wide range of disciplines

2 Module Descriptions

4 Contents:

Short Description
This course covers a selection of current topics in signal processing. One part of this course will follow a regular lecture format, while the other part will require active student participation.

Contents
This course will first review relevant aspects of linear algebra and probability theory. Then students will learn how to read, analyze, and present recent papers from the signal processing literature.

5 Learning outcomes and competences:
In this course, students will familiarize themselves with some current research topics in signal processing. They will learn to read and understand scientific publications and to critically evaluate results. Students will develop confidence in their ability to solve mathematical problems of analysis and design. They will be able to apply the principles they have learnt in this course to other areas.

**Contents**
Recapitulation of Basics (Maxwell’s equations, constitutive relations, continuity conditions, energy), the wave equation and its solutions, Snell’s law and Fresnel formulas, dispersion, waveguides, radiation of waves

#### 5 Learning outcomes and competences:

**Domain competence:**
After attending the course, the students will be able
- to mathematically model time harmonic electromagnetic field problems
- to identify and apply appropriate analytical methods
- to physically interpret and visualise the obtained results
- to extend, develop and validate theoretical models for electromagnetic field problems

**Key qualifications:**
The students
- learn to transfer the acquired skills also to other disciplines
- extend their cooperation and team capabilities as well as the presentation skills in the context of solving the exercises
- learn strategies to acquire knowledge from literature and internet
- acquire a specialised foreign language competence

## 4 Contents:

**Short Description**
The lecture gives an introduction to analysis and design of analog and digital circuits and systems. It builds on basic knowledge of electron devices (bachelor-level) and the compulsory lectures “Advanced System Theory” and “Modeling and Simulation”.

**Contents**
- Analysis methods for analog systems
- Analysis methods for digital systems
- Elementary analog and digital circuits
- Modeling and numerical simulation of analog and digital circuits and systems
- Typical components and subsystems
- Application examples

## 5 Learning outcomes and competences:

**Domain competence:**
The students will be able to
- describe appropriate methods for analysis and design of analog systems
- describe appropriate methods for analysis and design of digital systems
- assess the limitations of the different methods
- understand and calculate the behaviour of simple analog and digital circuits
- use a numeric simulation tool for electronic systems and circuit simulation
- describe typical components and subsystems

**Key qualifications:**
The lecture conveys an understanding of the interaction of different modeling techniques, mathematical analysis approaches, and numerical simulation, as well as how to apply these effectively to the design of technical systems. The methods for analog electronic design are transferrable to the design of continuous-time, continuous-amplitude systems. The methods for digital design are transferrable to the design of discrete-time, discrete-amplitude systems.

### 4 Contents:

#### Short Description

The course provides basic knowledge about the modern application-oriented modeling, simulation, analysis, and synthesis of digital systems at different abstraction levels to chip layout.

#### Contents

In today’s practice, chip design consists of the combined application of various languages, methods, and tools for the modeling, simulation, and synthesis of electronic circuits. Along the modern abstraction-based design flow of digital systems (electronic system level to chip layout), the course provides basic knowledge of the main description languages and their application in modeling, simulation, analysis and synthesis. This includes basic principles and application of the IEEE standard system/hardware description languages SystemVerilog, SystemC, Verilog, and VHDL, in conjunction with additional formats, e.g., SDF and UPF for time and power annotation. For their application, the fundamental principles of test environments for simulation, timing and power analysis, logic synthesis and physical design of digital circuits. Exercises will provide hands-on labs based on commercial tools from Mentor Graphics, Synopsys and, Cadence Design Systems.
Learning outcomes and competences:

Domain competence:
After the course students are able

- to model, simulate, analyze and synthesize simple digital circuits at different abstraction levels and
- to apply the most important commercial tools for simulation, analysis and synthesis of digital circuits.

Key qualifications:
After the course students are able

- to assess, select and apply modern digital circuit description languages for their different applications,
- apply the different methods and tools in the modern VLSI design.

Assessments:

- Modulabschlussprüfung (MAP)
- Modulprüfung (MP)
- Modulteilprüfungen (MTP)

### 2 Module Descriptions

#### 4 Contents:

**Short Description**
The course provides basic knowledge on analogue circuit technology with particular regard to complementary MOS transistors.

**Contents**

Based on simplified as well as advanced current-voltage characteristics of MOS transistors, analogue amplifier circuits are introduced and analyzed with respect of its DC behavior. Next, frequency performance, noise, effects of feedbacks, stability, non-linearity, and impacts of fabrication related asymmetries are considered. Further circuits such as oscillators, reference voltage sources, and switched capacitors are discussed. The course concludes with remarks on modeling and layout issues of basic devices.

#### 5 Learning outcomes and competences:

**Domain competence:**
After attending the course, the students will be able to

- analyse the characteristics of analogue circuits using scientific methods
- and can make creative use of the acquired knowledge in the circuit design process.

**Key qualifications:**
The students

- make use of methodic knowledge for systematic problem analysis,
- consolidate their basic knowledge by practical training,
- enhance their creative abilities,
- and gain foreign language competences related to the field.

## 2 Module Descriptions

### Contents:

**Short Description**
The course introduces the principle of flux-oriented control of three-phase AC motors, which is today's standard of electrical drives in industry. Unlike the course of the bachelor's program focus is put on the dynamics behavior and on the control structures. As most important examples, the permanent magnet synchronous motor and the induction motor are treated.

**Contents**
- AC drives: Synchronous and induction motor (structure, basic physical effects, modeling, equivalent circuit diagrams, characteristic curves, operation areas)
- Speed and torque control
- Space vector theory (fundamental wave, coordinate transformation)
- Principles of flux-oriented control
- Closed-loop control of current, torque and speed, design methods
- Direct Torque Control (DTC)
- Observers
- Applications in industry, road and rail vehicles

### Learning outcomes and competences:

**Domain competence:**
- The students will understand the most important types of AC drives, their properties and should be able to select and to design such drives by themselves.

**Key qualifications:**
The students learn
- to transfer the learned skills also to other disciplines,
- extend their cooperation and team capabilities as well as the presentation skills in the context of solving the exercises
- learn strategies to acquire knowledge from literature and internet.

2 Module Descriptions

Contents:

Short Description
With the depletion of fossil energy resources such as coal, oil, gas and the shut-down of the nuclear programs in many countries, the necessity to set-up an energy structure based on renewable energies with often fluctuating power output is a vast challenge for electrical engineering. This lecture faces that challenge explaining the functioning and performance parameters of all types of renewable energy conversion devices, their availability, interaction and adaptability to load structures. Vice versa, the adaptability of load curves to the availability of the energy sources shall be presented, including new concepts, e.g. decentralized generation, storage and energy management, in particular Demand-Side-Management, P2X.

Contents

1. Existing energy structures: History, development
2. Present components & systems: generation, transport, consumption
3. Characteristics of variable renewable energy sources: solar thermal, photovoltaics, wind power
4. Characteristics of renewable energy sources: hydro & wind power
5. Characteristics of steady renewable energy sources: biomass, geothermal energy
6. Individual and combined availability and performance
7. Energy management, transport (smart grid) and storage necessities
8. Storage devices and concepts: types, performance, costs
9. New concepts to minimize costs: decentralized, autonomous and semi-autonomous systems, swarm concepts, demand side management, (DSM), power to gas & heat (P2X)
10. Geographical differences: Local resources, potentials, load structures
11. Legislative issues: access to grid & electricity spot-market
12. Excursion to practical project examples

Learning outcomes and competences:

Domain competence:
After completing the course the students should in a position to: understand the implications, necessities and properties of an energy supply system (energy system 2.0) based on the combination of different renewable energy sources, distribution, storage, demand side management and be familiarized with the components, its specific characteristics and parameters.

** Key qualifications:**
The students are enabled to apply the knowledge and skills across disciplines are enabled to use method-oriented approaches for the implementation of sustainable energy supply are enabled to educate themselves in the future

Assessments:

- Modulabschlussprüfung (MAP)
- Modulprüfung (MP)
- Modulteilprüfungen (MTP)

4 Contents:

**Short Description**
The course High-Frequency Electronics provides necessary knowledge for the design of integrated high-frequency circuits ranging from device physics, semiconductor technology, high-frequency engineering, and packaging technology. Besides conveying new specialized knowledge, skills developed by various other courses are integrated, and thus students are directly prepared for a professional life in the field.

**Contents**
Starting from physically founded properties of different semiconductor systems, knowledge about the function, modeling, and fabrication of special high-frequency transistors is conveyed. Subsequently, all necessary steps of a high-frequency amplifier design are explained with respect to theoretical concepts and practical implementation. After that, further circuits such as broad-band amplifiers, oscillators, mixers and digital gates are presented. As currently most interesting applications, optoelectronic data transmission systems, mixed-signal systems such as ADC, DAC, digital synthesizers and PLL's, as well as millimeter wave transceivers are discussed. The course closes with an overview of high-frequency assembling and packaging technologies.

5 Learning outcomes and competences:

**Domain competence:**
After attending the course, the students will be able to
- select the most suitable semiconductor technology for a given problem,
- run the complete design process of a high-frequency integrated circuit,
- and to characterize fabricated samples.

**Key qualifications:**
The students
- can use of methodic knowledge for systematic problem analysis,
- include aspects of fabrication technology and economy into complex optimization problems,
- get familiar with the CAD system ADS, which is commonly used in industry
- and gain foreign language competences related to the field.

## Contents:

### Short Description

Mobile communications, wireless networks, and RFID technology are application examples of wireless communications. Wireless communications has found widespread use in everyday life and will become even more important in the future. The design of electronic circuits for radio frequencies requires a good system knowledge with respect to typical transmitter and receiver architectures in wireless communications, components, and radio signal properties. Furthermore a thorough understanding of integrated circuit design as well as precise high-frequency modeling of passive and active devices are required. Goal of the lecture is to convey a methodical approach to the design of integrated circuits for wireless communications. A part of the exercises will pertain to calculation of circuit design problems another will be performed in small teams as a hands-on exercise using modern IC design software.

### Contents

The lecture deals with analysis and design of radio frequency integrated circuits for wireless communication systems. A part of the exercises will be performed using modern chip design CAD tools. The lecture is based on the compulsory lectures “Schaltungstechnik” rsp. “Circuit and System Design”. The following topics will be addressed:

- Transmitter and receiver architectures for wireless communications
- System Theory Basics
- Signals and noise
- Modulation and demodulation
- Transmission properties of wireless communications systems
- Semiconductor technologies and integrated high-frequency devices
- Amplifiers (low-noise and variable-gain amplifiers)
- Mixers
- Oscillators
- Frequency synthesizer PLLs

## Learning outcomes and competences:

The students will be able

- to describe architectures and circuits of wireless communication systems
- to describe and calculate fundamental signal transmission properties of wireless systems
- to apply design methods to design components of radio frequency ICs
### 2 Module Descriptions

## 2 Module Descriptions

### 4 Contents:

#### Short Description

The lecture Micro-Electromechanical Systems consists of a technology oriented and a sensor based part to describe the integration and operation of modern microsystems based on silicon. It includes basic processes like wet and dry etching, physical principles for sensor effects, and common setups for sensor systems and packages.

#### Contents Processes

- Integration processes for 3D-microstructures
- Wafer bonding
- Lithography Galvanic
- Bulk micro machining
- Surface micro mechanics

#### Sensor Devices

- Acceleration sensors
- Pressure sensor devices
- Rotation rate sensors
- Special sensors

#### Actuators

- Principles of micro actuators
- Examples for integrated actuators
- Micro motors
- Ink jets
- Digital mirror arrays for image projection

#### Packaging

- Substrates and carriers
- Wire bonding
- Tape automated bonding
- Flip chip
- Chip size packages

### 5 Learning outcomes and competences:

#### Domain competence:

The students are able to describe the operational principle of microsystems and micro electromechanical systems. They can explain the transfer characteristics of the sensor devices and they are able to choose the right sensor for a given application.

#### Key qualifications:

The students

- learn to transfer the acquired skills also to other disciplines
- extend their cooperation and team capabilities as well as the presentation skills in the context of solving the exercises
- learn strategies to acquire knowledge from literature and internet

4 Contents:

Short Description
This course provides an introduction to the sophisticated and powerful Discontinuous Galerkin method in time domain. With this numerical technique it is possible to describe spatiotemporal effects like electromagnetic field propagation and other physical models which can be described by partial differential equations.

Contents

- Introduction, Motivation, History
- Basic elements of the Discontinuous Galerkin Method
- Linear systems * Theory foundation and discrete stability
- Nonlinear problems and properties
- Higher order, global problems
- Application to electromagnetic field simulation
**Learning outcomes and competences:**

**Domain competence:**
After attending the course, the student will be able to

- mathematically model complex electromagnetic field problems
- transfer, apply, validate the Discontinuous Galerkin method on physical problems
- to physically interpret and visualise the obtained results

**Key qualifications:**
The students

- learn to transfer the acquired skills also to other disciplines
- extend their cooperation and team capabilities as well as the presentation skills in the context of solving the exercises
- learn strategies to acquire knowledge from literature and internet
- acquire a specialised foreign language competence

2 Module Descriptions

4 Contents:

Short Description
The lecture Optical Communication B gives some knowledge about mode coupling in Optical Communication and explains the function of many optical components.

Contents
Mode Coupling (4 SWS, 6 ECTS credit points): Polarization mode dispersion, moden orthogonality, constant and periodic, co- and counterdirectional mode coupling, profiles of differential group delay, electrooptic effect. The function of many passive and active optical elements is thereby explained, among others amplitude and phase modulators, broadband and wavelength-selective couplers, Bragg gratings, polarization-maintaining fibers, polarization transformers, equalizers for polarization mode dispersion and chromatic dispersion.

5 Learning outcomes and competences:

Professional Competence
After attending the course, the students will be able, in the taught subjects, to

4 Contents:

Short Description
The lecture Optical Communication C gives knowledge in various optical modulation and demodulation techniques.

Contents
Modulation Formats (4 SWS, 6 ECTS credit points): Data transmission by differential binary and quaternary phase shift keying in the presence of optical amplifiers, polarization division multiplex, coherent optical data transmission, synchronous and asynchronous demodulation, coherent baseband receivers, polarization diversity, electronic compensators of optical distortions like electronic polarization control and electronic compensation of polarization mode dispersion and chromatic dispersion, phase noise, other modulation formats. Advanced modulation formats are an important possibility for the upgrading of high-performance optical information transmission systems.

### Contents:

#### Short Description

The lecture Optical Communication D gives knowledge about nonlinear optical effects in waveguides, their electronical detection, furthermore polarization scrambling.

#### Contents

Selected Topics (4 SWS, 6 ECTS credit points) in Optical Communication: Nonlinear distortions in glass fibers and their polarization dependence, electronic detection of linear optical distortions, polarization scrambling, . . . . Nonlinear distortions are important in practice and difficult to handle. The students should also prepare topics of their choice and present them to the others.
2 Module Descriptions

Learning outcomes and competences:

Professional Competence
After attending the course, the students will be able, in the taught subjects, to
- describe, model and apply the function of components, systems and effects of optical communications and
- apply knowledge of optoelectronics

(Soft) Skills
The students
- are able to apply the knowledge and skills to a wide range of disciplines,
- are able to make use of a methodical procedure when undertaking systematic analysis and
- are, due to the abstract and precise treatment of the contents, in a position to continue and develop their learning themselves

Assessments:

- Modulabschlussprüfung (MAP)
- Modulprüfung (MP)
- Modulteilprüfungen (MTP)

2 Module Descriptions

4 Contents:

Short Description
Dielectric optical waveguides constitute key-elements of present-day integrated optical / photonic circuits. This course provides an introduction to their theoretical background, and, as such, a sound basis for further, more specific, modelling, simulation, and design work, as well as for experimental activities in the field.

5 Learning outcomes and competences:

Domain competence: After attending the course, the student will be able to

- to mathematically model electromagnetic field problems of systems in integrated optics and photonics
- to identify, apply and verify appropriate analytical methods and approximation techniques
- to physically interpret and visualise the obtained results
- to extend, develop and validate theoretical models for integrated optics and photonics

Key qualifications: The students

- learn to transfer the acquired skills also to other disciplines
- extend their cooperation and team capabilities as well as the presentation skills in the context of solving the exercises
- learn strategies to acquire knowledge from literature and internet
- acquire a specialised foreign language competence

2 Module Descriptions

4 Contents:

Short Description
The task of power electronics is the conversion between various kinds of electrical energy by means of electronic circuits. The lecture introduces the modern power electronic principles and their tasks. The basic power electronic circuits are introduced and analyzed. Typical application examples from the fields of industry, energy and transportation are discussed.

Contents

- Modeling power electronic circuits as idealized switching networks
- Basic circuits of self-commutated converters: Buck and boost converters
- Basic circuits of line- and load-commutated converters
- Commutation, snubber circuits
- State-Space averaging
- Pulse width modulation, current and voltage ripples, harmonics
- Application examples from railway, automotive, industry, and energy generation and distribution

5 Learning outcomes and competences:

Domain competence:

- Understanding the modern principles of electrical energy conversion
- Competence to evaluate, select and design power electronic circuits

Key qualifications:

The students

- learn to transfer the learned skills also to other disciplines,
- extend their cooperation and team capabilities as well as the presentation skills in the context of solving the exercises,
- learn strategies to acquire knowledge from literature and internet.

## Admission requirements:
Keine

## Contents:

### Short Description
The lecture Processing of Semiconductors describes the technical steps to build integrated circuits on silicon wafers. Physical models of the process steps will be given and the technical equipment will be explained. The students are able to explain the integration process for integrated circuits in detail.

### Contents
- Oxidation of Silicon
- Optical Lithography and Electron Beam Lithography
- Diffusion of Dopants
- Ion Implantation
- Epitaxy
- Chemical Vapour Deposition
- Physical Deposition Techniques
- MOS Processes
- CMOS Technology
- Packaging (in short)

## Learning outcomes and competences:

### Domain competence:
The students are able to explain the equipment and the processes of the semiconductor technology. They are able to apply this knowledge for the integration of complex integrated circuits.

### Key qualifications:
Systematic of solving problems, detection of spreading influences

4. **Contents:**

**Short Description**
The course provides basic knowledge on the design of integrated RF power amplifiers, in particular for mobile communication and sensor applications.

**Contents**
The course starts with an overview on analysis and simulation techniques for non-linear circuits. After that, first the conventional amplifier classes A, AB, B, and C are analysed and in particular overdrive effects are investigated. Second, the specific amplifier classes D, E, F, and S are introduced. Next, dedicated measures for the efficiency enhancement and linearization are described and particular amplifier architectures are presented. The course ends with an overview on semiconductor fabrication technologies for power amplifiers.

5. **Learning outcomes and competences:**

**Domain competence:**
After attending the course, the students will be able to
- describe and analyse the performance of non-linear amplifiers,
- distinguish, make dedicated use, and dimension power amplifiers of different classes,
- take effective measures for efficiency enhancement and linearization,
- and to select appropriate semiconductor fabricated technologies for given problems.

**Key qualifications:**
The students
- can make use of methodic knowledge for systematic problem analysis,
- include aspects of fabrication technology and economy into complex optimization problems,
- get familiar with the CAD system ADS, which is commonly used in industry
- and gain foreign language competences related to the field.

Contents:

Short Description
The lecture Sensor Technology describes the physical behaviour of typical sensors and their applications in industry. Ranges and limitations of the sensors are presented. The lecture includes thermal sensors, force and magnetic sensors, gas and humidity sensitive devices.

Contents
Temperature Sensors:
- Metal Resistors
- NTC
- PTC
- Junction Sensor
- Spreading Resistance Temperature Sensor
- Thermoelectric Sensors

Optical Sensors:
- Resistances and Diodes
- Photo Transistors
- CCD
- Thermal Column

Magnet Field Sensors:
- Hall Sensor
- Gauss Sensor Plate
- Ferromagnetic Resistive Sensors
- Split Drain Transistor
- Magneto Diode
- Flux-Gate-Sensor

Acceleration Based Sensors:
- Force
- Acceleration
- Rotation Rate Sensors

Gas Sensors:
- Metal-Oxide Sensors
- Catalytic Sensors
- SAW Sensors
5 Learning outcomes and competences:

Domain competence:
The students are able to describe the operation principle of different kinds of sensor devices and can choose a suitable sensor for a given application. They can explain the setup or manufacturing processes for the sensor devices. They can write down the sensitivity of different kind of sensors.

Key qualifications:
The students learn:

- to transfer the knowledge of sensor devices to other applications
- to work in groups to solve problems
- thinking in systems, not on device level

**Short Description**

The course “VLSI Testing” focuses on techniques for detecting hardware defects in micro-electronic circuits. Algorithms for test data generation and test response evaluation as well as hardware structures for design for test (DFT) and on-chip test implementation (BIST) are presented.

**Contents**

In detail the following topics are covered:

- Fault models
- Testability measures and design for test (DFT)
- Logic and fault simulation
- Automatic test pattern generation (ATPG)
- Built-in self-test (BIST), in particular test data compression and test response compaction
- Memory test
2 Module Descriptions

5 Learning outcomes and competences:

Domain competence:
After attending the course, the students will be able

- to describe fault models, DFT techniques, and test tools,
- to explain and apply the underlying models and algorithms for fault simulation and test generation,
- to analyze systems with respect to their testability and to derive appropriate test strategies.

Key qualifications:
The students

- are able to apply the practiced strategies for problem solving across varying disciplines,
- have experience in presenting their solutions to their fellow students, and
- know how to improve their competences by private study.

- Hands-on exercises using various software tools

Teaching Material, Literature
Additional material can be found in koala

2.6 Projects

Students have to carry out either two projects each lasting one semester with 9 CP each, or one project lasting two semesters with 18 CP. The topics analysis, design, realization and test will be covered in small groups (max. 10 students). The projects are offered by the different research groups from the institute EIM-E.

3 Admission requirements:
Keine

4 Contents:
Project groups will be formed as teams to work on tasks where the relevant subjects are embedded in the scientific environment of the institute and its versatile, close cooperations with enterprises and industries. The intercommunication between the institute and renowned companies opens up numerous and attractive tasks for project works and serves to underline the relevance for the professional field and the employment market, and to support the acquisition of interdisciplinary competences.

5 Learning outcomes and competences:
In the course of the project work students should practice independent, scientific and engineering processing of clearly defined theoretical and practical tasks within the team. This should enable them to solve complex problems as a team, while at the same time acquiring the capability for independent working as well as organizational skills. The students should also learn to formulate the research task, document the methods and analysis and present the findings of their work in a structured manner. Having completed the project work, the students will command in-depth technical competences in a selected area and understand the application relevance of their course contents.

### Contents:

#### Short Description
This is an introductory course to the C++ programming language, which is intended for those ESE master students who have little programming background and are going to take the advanced courses, e.g. Introduction to Algorithms and/or Software Engineering. In principle, the course will be designed as: lecture (2 h/w) + programming practice (1 h/w). Note: this is a supplementary course with no credit. Students will gain a lot of useful knowledge and increase their value on the job market! We highly encourage students to make use of this offer.

#### Contents
This course should give an overview on the C++ language. During the winter semester, we are going to study the following concepts in C++ programming (depends on the teaching progress):

**Background and basic introduction:**
- history of C and C++
- programming environments
- basic terms / concepts

**Basic C++ programming:**
- primitive variable types
- expressions / statements
- functions
- memory management / pointers / arrays
- structures / unions / enumerations
- strings / vectors
- classes
- smart pointers / move semantics

**The C++ standard template library (STL):**
- IO library
- containers
- generic algorithms

**Advanced techniques:**
- operator overloading
- template programming
- object-oriented programming
- embarrassing parallel: OpenMP

**Useful libraries for further projects:**
- common used C++ libraries
- where to find the right material
## Module Descriptions

### 5 Learning outcomes and competences:

**Domain competence:**
After having attended this course, students might obtain following benefits:

- understand modern C++
- be confident to take advanced courses that require C++ programming
- the ability to easily realize programming tasks / projects
- promoted from a C programmer to a state-of-art C++ programmer
- the ability to develop a real object-oriented program
- gain additional understanding of how a computer works
- better understanding of (computationally) problems
- know where to find the desired information to realize a challenging task on your own

### 6 Assessments:

### 7 Study Achievement:
keine

### 8 Prerequisites for participation in examinations:

**Short Description**

The master thesis is a written examination paper to be authored without external help, and completes the scientific training. A thesis written as group work is also admissible if the individual candidate’s contribution to be assessed as an exam paper can be distinguished and evaluated on the basis of sections or pages specified and other objective criteria allowing a clear differentiation.

**Contents**

The concrete content of the master thesis depends on the task defined by the supporting group of the institute. The focus of the thesis can either be placed on the methods applied, or the thesis can be oriented towards the applications. In both cases, the thesis subject will be embedded in the scientific environment of the institute and its versatile, close cooperations with enterprises and industries. The intercommunication between the institute and renowned companies opens up numerous and attractive tasks for master papers and serves to underline the relevance for the professional field and the employment market, and to support the acquisition of interdisciplinary competences.
5 Learning outcomes and competences:
By completing the master thesis the graduates prove their capability to elaborate on a problem in electrical engineering within a defined period of time by applying scientific methods. The thesis will also serve to prove that the graduates are capable of applying competences acquired in the course of their studies, in particular technical-methodical competences and where applicable interdisciplinary competences.

6 Assessments:

<td>Modulabschlussprüfung (MAP)</td>
<td>Modulprüfung (MP)</td>
<td>Modulteilprüfungen (MTP)</td>
</tr>
</tbody>
</table>

7 Study Achievement:
keine

8 Prerequisites for participation in examinations:
None

9 Prerequisites for assigning credits:
The credit points are awarded after the module examination (MAP) was passed.

10 Weighing for overall grade:
The module is weighted according to the number of credits (factor 1).

11 Reuse in degree courses:
keine

12 Module coordinator:
Dr.-Ing. Carsten Balewski

13 Other Notes:
Supervision by academic staff of the institute
