## **1** Preambles and Indications

For technical reasons the preamble of the module catalogue was relocated. It can be found at Regulations and Module Handbook in the category "Module Catalogues" on the pages of the Department EIM-E. Please take account of this preamble. In case of questions relating to this preamble, please contact

- the Student Advisory Service of Electrical Systems Engineering or
- the Course Management of Electrical Engineering.

Please also note that

- 1. all modules are listed in this module catalogue as determined by the respective examination regulation even if they are not offered in the current semester.
- 2. this module catalogue contains the content of the database on the creation date. All information supplied is subject to correction.

#### 2.1 Module Group: Introduction to Electrical Systems Engineering

The modules of this group are compulsory to all MS-ESE students.

Module Group	Introduction to Electrical Systems Engineering
Modules	* Advanced System Theory
	* Modeling and Simulation
Teaching objectives	The students in the Master's program ESE have a very heterogeneous educational background. These two modules should provide a common level for all other modul to come.

The first module will provide a theoretical and methodological understanding of electrical systems. Nowadays, the process of developing electrical systems is assisted by various modeling and simulation tools. Therefore, the second module will give an overview of the underlying principles of modeling and simulation techniques and discuss their advantages as well as their limits.

#### 2.1.1 Advanced System Theory

Advanced System Theory								
Module number: Workload (h): Credits: Regluar Cycle:								
M.048.92001	180 6		Wintersemester

5	<ul> <li>Contents:</li> <li>Short Description         Building on an undergraduate system theory course, this course studies the dynamical behavior linear systems with greater mathematical rigor. The course is primarily intended to serve stud in engineering, but it can also be useful to students in physics and other natural sciences.         Contents         System models and differential equations, state-space and I/O descriptions, relations betwee internal and external descriptions, response of continuous- and discrete-time systems, state controllability, observability, state-space realizations of external descriptions, feedback system     </li> <li>Learning outcomes and competences:         After attending this course, students will be familiar with the most important concepts and resign in linear system theory. Students will develop confidence in their ability to solve mathematical problems of analysis and design. Many of their timeless insights and intuitions about the dynamic behavior of systems will be drawn from this course. This course presents material broad endormal states and states are allocated by the solve mathematical states are allocated by the solve mathematicallocated by the solve mathematical states are allocated by th</li></ul>					erve students inces. ons betweer ems, stability ck systems. s and results mathematica he dynamica iroad enough ear systems				
6	including their power and limitations. This will allow students to apply the theory to other fields. Assessments:

	Implementation
	The theoretical concepts are taught in lecture form. The exercises consist of simple questions to be discussed as well as classical mathematical problems which are to be solved by the students in self-contained manner. Further, the students will use self-written as well as commercial software for selected topics.

## 2.2 Module Group: Management and Application

Two compulsory modules for all MS-ESE students.

Module Group	Introduction to Electrical Systems Engineering			
Modules	* Management of Technical Projects			
	* Topics in System Engineering			
Teaching objectives	In the first module students will acquire soft skills on how to manage technical projects (e.g. requirement analysis, specification, scheduling, planning & design-ing, monitoring & controlling, communication in teams, communication with customers). The second module is organized as a project seminar offered alternatingly by different research groups of the institute EIM-E. The students will be familiarized with on-going projects. The aim is to demonstrate project management in real world examples.			

#### 2.2.1 Management of Technical Projects

## 2.3 Module Group: Fundamentals of Electrical Systems Engineering

These compulsory elective modules are meant to close gaps in the knowledge of students. They choose two from a list of six modules

Module Group	Fundamentals of Electrical Systems Engineering
Modules	* Circuit and Systems Design
	* Fields & Waves
	* Digital Speech Signal Processing
	* High Frequency Engineering
	* Introduction to Algorithms
	* Mechatronics and Electrical Drives
	* Software Engineering
Teaching objectives	As students with quite different backgrounds may enter this Master's program it is necessary to harmonize their knowledge background.

For a student with a Bachelor degree in Electrical Engineering it may be e.g. necessary to fill up knowledge gaps in the field of Software Engineering, while students with a Computer Engineering degree should perhaps attend a module in Mechatronics & Electrical Drives. Students will be advised on which two modules out of the following list to choose from.

Advanced Control

4	Contents:
	Short Description The course introduces the basic techniques and theories of digital speech signal processing. A focal point of the first part of the lecture is the topic "Listening and Speaking", which is concerned with psychological effects of human sound perception and speech production. Subsequently, time discrete signals and systems, as well as computer based data processing are discussed. Further topics are non-parametric short-time analysis of speech signals, speech coding and IP-phones. Contents
	<ul> <li>Listen and talk o Generating voice: human vocal tract, source filter model, vocoder o Acoustic waves o Listen: human ear, psycho acoustics and physiology of listening, loudness, acoustic occlusion, frequency groups</li> <li>Time-discrete signals and systems o Basics: Elementary signals, LTI systems o Transformations: Fourier transformation of time-discrete signals, DFT, FFT o Time-discrete filtering in frequency domain: Overlap-Add, overlap-Save</li> <li>Statistical speech signal analysis o Basics in theory of probabilities o Short-run analysis of speech signals: Spectrogram, cepstrum</li> <li>Estimation of speech signals o Optimal filters o LPC analysis o Spectral filtering for noise suppression: spectral subtraction, Wiener filter o Adaptive Filters: LMS adaptation algorithm, echo compensation</li> <li>Speech coding o Time domain coding: signal shape coding, parametric coding, hybride coding tech-niques o Frequency domain coding o Amplitude quantization: uniform quantization, quantization with companders (ulaw, alaw)</li> </ul>
5	Learning outcomes and competences:
	<b>Domain competence:</b> After attending the course, the students will be able to
	<ul> <li>analyze digital signals, e.g., audio signals, in the time or frequency domain,</li> <li>represent audio signals efficiently and</li> <li>implement widely-used algorithms for speech analysis and speech processing in the frequency or time domain.</li> </ul>
	Key qualifications: The students
	<ul> <li>are able to explain effects in real signals based on the theoretical knowledge,</li> <li>are able to investigate theoretical approaches by a systematic analysis and</li> <li>are, due to the precise treatment of the contents, in a position to continue their learning themselves</li> </ul>

## 2.4 Specialization-Specific: Signal and Information Processing

#### 2.4.1 Module Group: Introduction to Signal and Information Processing

The modules of this group are compulsory to all MS-ESE students choosing the specialization Signal and Information Processing (S&IP).

Module Group	Introduction to Signal and Information Processing
Modules	* Statistical Signal Processing
	* Statistical Learning and Pattern Recognitionm
Teaching objectives	The students will acquire fundamental knowledge on how to apply statistical methods to signals and under-stand the paradigms of learning paradigms and classification.

Statistical Learning and Pattern Recognition

#### 2.4.2 Module Group: Signal and Information Processing

The module group contains a wide selection of modules from which the students can choose two modules.

Module Group	Signal and Information Processing
Modules	* Advanced Control
	* Advanced Control Methods for Mechatronics
	* Advanced Topics In Robotics
	<ul> <li>* Algorithms and Tools for Test and Diagnosis of Systems on a Chip</li> </ul>
	* Cognitive Systems Engineering
	* Digital Image Processing I
	* Digital Image Processing II
	* Dynamic Programming and Stochastic Control
	* Numerical Simulations with the Discontinuous Galerkin Time Domain Method
	* Optical Waveguide Theory
	* Optimal and Adaptive Filters
	* Robotics
	* Topics in Audio, Speech, and Language Processing
	* Topics in Pattern Recognition and Machine Learning
	* Topics in Signal Processing
	* Wireless Communications
Teaching objectives	The students select two modules according to their interests in the chosen specialization to acquire expertise in certain topics.

### 4 Contents:

This module is offered in two parts. Students have to choose two out of three. Each part lasts two hours per week and yields three credits.

• Cognitive Systems Engineering A - Visual Attention

In the winter semester a project seminar takes place which introduces students to the modeling and experimental research of visual attention, and thus to current research at the chairs of GET Lab and Cognitive Psychology. It is also intended to demonstrate the possibility of joint research across boundaries of different disciplines. The current focus lies on salience.

• Cognitive Systems Engineering B - Sensation and Perception in Biological Systems

Part B (summer semester) offers a broad overview of the fundamentals of sensation and perception in biological systems and the associated intriguing phenomena. The treatment of these topics is interwoven with a critical discussion concerning the implementation of bio-inspired mechanisms in technical systems.

• Cognitive Systems Engineering C - GET Research Seminar

In summer semester and winter semester various presentations take place: current interim reports and results of seminar papers and diploma theses in progress, research projects and third-party funded projects focusing on research in the field of technical cognitive systems; lectures by guests of the GET Lab.

5	Learning outcomes and competences:								
	After attending this course, students will have understood the basics of dynamic programming and stochastic control. Students will learn the dynamic programming optimality principle and how it can be used to solve multi-stage decision making problems. They will learn how to formulate and solve, using dynamic programming, problems in different areas such as control, communications, signal processing, and machine learning.

Contents:
Short Description The course "Optimal and adaptive filters" gives an introduction to the basic techniques and theo- ries of adaptive filters. Based upon the basics of estimation theory optimal filters are discussed. Subsequently the topics Wiener filter theory, deterministic optimization under constraints and sto- chastic gradient methods are regarded. Concluding the Least Squares approach for solving filter tasks and the Kalman filter are introduced. The latter is regarded as a brief introduction to state based filters. Contents
<ul> <li>Classic parameter estimation o Estimators o MMSE-Estimation o Linear estimators o Or- thogonality principle o Evaluation of estimators</li> </ul>
<ul> <li>Wiener filter o Wiener-Hopf equation o AR- and MA processes o Linear prediction</li> </ul>
<ul> <li>Iterative optimization methods o Gradient ascent/descent o Newton method</li> </ul>
<ul> <li>Linear adaptive filters o LMS algorithm o Least-Squares method o Blockwise and recursive adaptiv filters o Realization aspects</li> </ul>
<ul> <li>Statemodel based filters o Kalman filter</li> </ul>
<ul> <li>Applications o System identification o Channel estimation and equalization o Multi-channel speech signal processing o Noise and interference suppression</li> </ul>
Learning outcomes and competences:
<b>Domain competence:</b> After attending the course, the students will be able to
<ul> <li>analyze task on the field of adaptive filters and to formulate requirements mathematically,</li> <li>develop filter using cost functions and</li> <li>implement selected adaptive filters in the frequency or time domain.</li> </ul>
Key qualifications: The students
<ul> <li>are able to check theoretical results using practical realizations,</li> <li>are able to undertake theoretical approaches a systematic analysis using methodical procedures and</li> <li>are, due to the precise treatment of the contents, in a position to continue their learning themselves</li> </ul>

### 4 Contents:

### **Short Description**

The course on Topics in Pattern Recognition and Machine Learning first briefly summarizes the main concepts of statistical pattern recognition and machine learning. Next selected topics will be presented in detail. The choice of topics depends on current research activities and thus may change over time. Examples of such topics to be studied in detail include

- Deep Learning
- Model estimation in the presence of hidden variables, in order to reveal suspected latent structure buried in the data
- Bias-Variance dilemma and the tradeoff between degree of detail and generalizability of models
- Grafical models
- Sequential data and hidden Markov models
- Specific classification tasks, such as automatic speech recognition While the first part of the course will follow a regular lecture format, the second part will include active student participation. Students will be asked to read, analyze and present recently published papers from the pattern recognition and machine learning literature. This will often also include the implementation of proposed algorithms in Matlab.

#### Contents

- Fundamentals of statistical pattern recognition: Bayes rule, learning of class-conditional densities, linear models for classification and regression
- Deep neural networks
- EM Algorithm and extensions thereof
- · Models with discrete or continuous latent variables; GMM, NMF
- Bias-Variance dilemma and model selection
- Graphical models
- Hidden Markov models and their application in speech recognition
- Recent publications in pattern recognition and machine learning

5	Learni	ng outcomes and competences:						
	<b>Domain competence:</b> After completion of the course students will be able to * Choose an appropriate classifier for a given classification problem and be able to learn the parameters of the classifier from training data							
	<ul> <li>Choose an appropriate regression method for function approximation and learn its parameters from training data</li> <li>Search for latent variables and structure in given data</li> <li>Make an informative choice for the model order to find a good compromise between degree of detail and generalizabliliy</li> <li>Comprehend and analyze recent publications from the field of pattern recognition and machine learning</li> </ul>							
	<b>Key qu</b> The stu	ualifications: udents						
	<ul> <li>Have gathered an understanding of the importance of the chosen model order on the outcome of classification and regression tasks</li> <li>Are aware of the impact of a priori assumptions on the result of latent variable and structure discovery in data</li> <li>Are able to autonomously gain expertise in a certain field of pattern recognition by conducting a literature survey</li> <li>Can gauge the importance of a given publication for the state of the art in a field</li> <li>Are able to apply the knowledge and skills learnt in this course to a wide range of disciplines</li> </ul>

# 2.5 Specialization-Specific: Electronics and Devices

### 2.5.1 Module Group: Introduction to Electronics and Devices

The modules of this group are compulsory to all MS-ESE students choosing the specialization Electronics and Devices (E&D).

Module Group	Introduction to Signal and Information Processing
Modules	* Circuit and Systems Design
	* Fields & Waves
Teaching objectives	The students will acquire fundamental knowledge in theoretical electrical engineering and the design of electrical systems including their components.

Fields & Waves

## 2.5.2 Module Group: Electronics and Devices

The module group contains a wide selection of modules from which the students can choose two modules.

Module Group	Electronics and Devices
Modules	* Advanced VLSI Design
	* Analog CMOS Ics
	* Controlled AC Drives
	* Energy Transition
	* Fast Integrated Circuits for Digital Communications
	* High-Frequency Electronics
	* Integrated Circuits for Wireless Communications
	* Micro-Electromechanical Systems
	* Numerical Simulations with the Discontinuous Galerkin Time Domain Method
	* Optical Communication A
	* Optical Communication B
	* Optical Communication C
	* Optical Communication D
	* Optical Waveguide Theory
	* Power Electronic Devices
	* Power Electronics
	* Processing of Semiconductor Devices
	* Radio Frequency Power Amplifiers
	* Sensor Technologie
	* Switched Mode Power Supplies
	* System Technology for Renewable Battery Systems
	* VLSI Testing
Teaching objectives	The students select two modules according to their interest in the chosen specialization to acquire expertise in certain topics.

Advanced VLSI Design

#### **Short Description**

With the depletion of fossil energy resources such as coal, oil, gas and the shut-down of the nuclear programs in many countries, the necessity to set-up an energy structure based on renewable energies with often fluctuating power output is a vast challenge for electrical engineering. This lecture faces that challenge explaining the functioning and performance parameters of all types of renewable energy conversion devices, their availability, interaction and adaptability to load structures. Vice versa, the adaptability of load curves to the availability of the energy sources shall be presented, including new concepts, e.g. decentralized generation, storage and energy management, in particular Demand-Side-Management, P2X.

#### Contents

- 1. Existing energy structures: History, development
- 2. Present components & systems: generation, transport, consumption
- 3. Characteristics of variable renewable energy sources: solar thermal, photovoltaics, wind power
- 4. Characteristics of renewable energy sources: hydro & wind power
- 5. Characteristics of steady renewable energy sources: biomass, geothermal energy
- 6. Individual and combined availability and performance
- 7. Energy management, transport (smart grid) and storage necessities
- 8. Storage devices and concepts: types, performance, costs
- 9. New concepts to minimize costs: decentralized, autonomous and semi-autonomous systems, swarm concepts, demand side management, (DSM), power to gas & heat (P2X)
- 10. Geographical differences: Local resources, potentials, load structures
- 11. Legislative issues: access to grid & electricity spot-market
- 12. Excursion to practical project examples

### 5 Learning outcomes and competences:

#### Domain competence:

After completing the course the students should in a position to: understand the implications, necessities and properties of an energy supply system (energy system 2.0) based on the combination of different renewable energy sources, distribution, storage, demand side management and be familiarized with the components, its specific characteristics and parameters. \*\* Key gualifications:\*\*

The students are enabled to apply the knowledge and skills across disciplines are enabled to use method-oriented approaches for the implementation of sustainable energy supply are enabled to educate themselves in the future

### 6 Assessments:

#### **Short Description**

Mobile communications, wireless networks, and RFID technology are application examples of wireless communications. Wireless communications has found widespread use in everyday life and will become even more important in the future. The design of electronic circuits for radio frequencies requires a good system knowledge with respect to typical transmitter and receiver architectures in wireless communications, components, and radio signal properties. Furthermore a thorough understanding of integrated circuit design as well as precise high-frequency modeling of passive and active devices are required. Goal of the lecture is to convey a methodical approach to the design of integrated circuits for wireless communications. A part of the exercises will pertain to calculation of circuit design problems another will be performed in small teams as a hands-on exercise using modern IC design software.

#### Contents

The lecture deals with analysis and design of radio frequency integrated circuits for wireless communication systems. A part of the exercises will be performed using modern chip design CAD tools. The lecture is based on the compulsory lectures "Schaltungstechnik" rsp. "Circuit and System Design". The following topics will be addressed:

- Transmitter and receiver architectures for wireless communications
- System Theory Basics
- · Signals and noise
- Modulation and demodulation
- Transmission properties of wireless communcations systems
- Semiconductor technologies and integrated high-frequency devices
- Amplifiers (low-noise and variable-gain amplifiers)
- Mixers
- Oscillators
- Frequency synthesizer PLLs

#### 5 Learning outcomes and competences:

The students will be able

- · to describe architectures and circuits of wireless communication systems
- to describe and calculate fundamental signal transmission properties of wireless systems
- to apply design methods to design components of radio frequency ICs

#### 4 **Contents:**

#### Short Description

The lecture Micro-Electromechanical Systems consists of a technology oriented and a sensor based part to describe the integration and operation of modern microsystems based on silicon. It includes basic processes like wet and dry etching, physical principles for sensor effects, and common setups for sensor systems and packages. **Contents** Processes

- Integration processes for 3D-microstructures
- Wafer bonding
- Lithography Galvanic
- Bulk micro machining
- Surface micro mechanics

#### Sensor Devices

- Acceleration sensors
- Pressure sensor devices
- Rotation rate sensors
- · Special sensors

#### Actuators

- Principles of micro actuators
- Examples for integrated actuators
- Micro motors
- Ink jets
- Digital mirror arrays for image projection

### Packaging

- Substrates and carriers
- Wire bonding
- Tape automated bonding
- Flip chip
- Chip size packages

#### Learning outcomes and competences: 5

**Domain competence:** The students are able to describe the operational principle of microsystems and micro electromechanical systems. They can explain the transfer characteristics of the sensor devices and they are able to choose the right sensor for a given application. Key qualifications:

The students

- learn to transfer the acquired skills also to other disciplines
- extend their cooperation and team capabilities as well as the presentation skills in the context of solving the exercises
- · learn strategies to acquire knowledge from literature and internet

4	Contents:								
	The course starts with an overview on analysis and simulation techniques for non-linear circuits. After that, first the conventional amplifier classes A, AB, B, and C are analysed and in particular overdrive effects are investigated. Second, the specific amplifier classes D, E,F, and S are introduced. Next, dedicated measures for the efficiency enhancement and linearization are described and particular amplifier architectures are presented. The course ends with an overview on semiconductor fabrication technologies for power amplifiers.								
5	Learning outcomes and competences:								
	<b>Domain competence:</b> After attending the course, the students will be able to								
	<ul> <li>describe and analyse the performance of non-linear amplifiers,</li> <li>distinguish, make dedicated use, and dimension power amplifiers of different classes,</li> <li>take effective measures for efficiency enhancement and linearization,</li> <li>and to select appropriate semiconductor fabricated technologies for given problems.</li> </ul>								
	<b>Key qι</b> The stι		tions:						
	<ul> <li>can make use of methodic knowledge for systematic problem analysis,</li> <li>include aspects of fabrication technology and economy into complex optimization problems</li> <li>get familiar with the CAD system ADS, which is commonly used in industry</li> <li>and gain foreign language competences related to the field.</li> </ul>

## 2.6 Projects

Students have to carry out either two projects each lasting one semester with 9 CP each, or one project lasting two semesters with 18 CP. The topics analysis, design, realization and test will be covered in small groups (max. 10 students). The projects are offered by the different research groups from the institute EIM-E.

4	Contents:							
	Project groups will be formed as teams to work on tasks where the relevant subjects are embed- ded in the scientific environment of the institute and its versatile, close cooperations with enter- prises and industries. The intercommunication between the institute and renowned companies opens up numerous and attractive tasks for project works and serves to underline the relevance for the professional field and the employment market, and to support the acquisition of interdisci- plinary competences.							
5	Learni	ng outcomes and competences:						
	In the course of the project work students should practice independent, scientific and engineering processing of clearly defined theoretical and practical tasks within the team. This should enable them to solve complex problems as a team, while at the same time acquiring the capability for independent working as well as organizational skills. The students should also learn to formulate the research task, document the methods and analysis and present the findings of their work in a structured manner. Having completed the project work, the students will command in-depth technical competences in a selected area and understand the application relevance of their course contents.

## 2.7 General Studies

Students may choose freely from all modules offered at the University. However, it is recommended that students with limited or no proficiency in German devote part of their studies to acquire German language skills.

Workload:

Time of attendance: 2x30h; individual study: 2x60 h; total workload: 180 h

## 2.7.1 C++ Programming

C++	Progra	mming	3							
C++	- Program	nming

	keine							
4	Contents:							
	Short Description This is an introductory course to the C++ programming language, which is intended for those ESE master students who have little programming background and are going to take the advanced courses, e.g. Introduction to Algorithms and/or Software Engineering. In principle, the course will be designed as: lecture (2 h/w) + programming practice (1 h/w). Note: this is a supplementary course with no credit. Students will gain a lot of useful knowledge and increase their value on the job market! We highly encourage students to make use of this offer. Contents This course should give an overview on the C++ language. During the winter semester, we are going to study the following concepts in C++ programming (depends on the teaching progress): Background and basic introduction:							
	<ul> <li>history of C and C++</li> <li>programming enviroments</li> <li>basic terms / concepts</li> </ul>							
	Basic C++ programming:							
	<ul> <li>primitive variable types</li> <li>expressions / statements</li> <li>functions</li> <li>memory management / pointers / arrays</li> <li>structures / unions / enumerations</li> <li>strings / vectors</li> <li>classes</li> <li>smart pointers / move semantics</li> </ul>							
	The C++ standard template library (STL):							
	<ul><li>IO library</li><li>containers</li><li>generic algorithms</li></ul>							
	Advanced techniques:							
	<ul> <li>operator overloading</li> <li>template programming</li> <li>object-oriented programming</li> <li>embarrassing parallel: OpenMP</li> </ul>							
	Useful libraries for further projects:							
	<ul> <li>common used C++ libraries</li> <li>where to find the right material</li> </ul>							

5	Learning outcomes and competences:								
	Domain competence:								
	After having attended this course, students might obtain following benefits:								
	<ul> <li>understand modern C++</li> <li>be confident to take advanced courses that require C++ programming</li> <li>the ability to easily realize programming tasks ( projects)</li> </ul>								
	<ul> <li>the ability to easily realize programming tasks / projects</li> <li>promoted from a C programmer to a state-of-art C++ programmer</li> </ul>								
	the ability to develop a real object-oriented program								
	<ul> <li>gain additional understanding of how a computer works</li> <li>better understanding of (computationally) problems</li> </ul>								
	know where to find the desired information to realize a challenging task on your own

# 2.8 Master's Thesis

Students have to carry out a Master's thesis of one semester duration, resulting in 30 CP.

Workload:

Full time for one semester - total workload: 900 h

Mas	ster thesis

	None								
3	Admission re	equierements:							
	Die Voraussetzungen für den Beginn der Masterarbeit sind in § 10 Abs. 3 der Prüfungsordnung geregelt.								
4	Contents:								
	Short Description The master thesis is a written examination paper to be authored without external help, and completes the scientific training. A thesis written as group work is also admissible if the individual candidate's contribution to be assessed as an exam paper can be distinguished and evaluated on the basis of sections or pages specified and other objective criteria allowing a clear differentiation. Contents The concrete content of the master thesis depends on the task defined by the supporting group of the institute. The focus of the thesis can either be placed on the methods applied, or the thesis can be oriented towards the applications. In both cases, the thesis subject will be embedded in the scientific environment of the institute and its versatile, close cooperations with enterprises and industries. The intercommunication between the institute and renowned companies opens up numerous and attractive tasks for master papers and serves to underline the relevance for the professional field and the employment market, and to support the acquisition of interdisciplinary competences.								

5	Learning outcomes and competences:									
	By completing the master thesis the graduates prove their capability to elaborate on a problem in electrical engineering within a defined period of time by applying scientific methods. The thesis will also serve to prove that the graduates are capable of applying competences acquired in the course of their studies, in particular technical-methodical competences and where applicable interdisciplinary competences.
